	Concrete Corrosion Inhibitors Association	Their Industry uses calcium salt, and essentially organic salts (calcium nitrite made from oxidizing ammonia). Their Industry Association promotes the use of concrete inhibitors and the corrosion inhibitors have no health hazards because they stay inside of the concrete for their life-span. Performance Standard wise, they perform very well, while corrosive salts decompose reinforcing steel inside concrete. For example, they built a very expensive highway during Eisenhower's Presidency, but it was destroyed by corrosive salt and that was a very expensive mistake, corrosion inhibitors prevent that, re-enforcing steel isn't affected anymore and won't destroy concrete doesn't destroy it. Models say that concrete will last hundreds of years, corrosion is an electro-chemical phenomenon and there-by model, Disposal issues-redmix trucks there's left-over concrete, they tend to pour water into the trucks to reuse concrete the next day, really good redi-mix operation, very little disposed because you can reuse it, take a potted bridge after 500, you could reuse for roads and other things.
